## 1. Introduction

---

The Ved Tech Labs API is a comprehensive SMS messaging platform that provides developers with multiple interfaces to send SMS messages. The API supports HTTP/HTTPS protocols and offers three main integration methods: PUSH API, XML Interface, and JSON API.

This manual covers all aspects of the Ved Tech Labs API, including authentication, parameter specifications, request/response formats, and error handling. The API is designed to handle both single and bulk SMS messaging with support for plain text and Unicode messages.

### Key Features:

- Multiple API interfaces (HTTP, XML, JSON)

- Support for both GET and POST methods
- Plain text and Unicode message support
- Bulk messaging capabilities
- Short URL generation and tracking
- DLT compliance with Entity ID and Template ID support

## 2. Authentication

---

The Ved Tech Labs API uses a combination of username and API key for authentication. All requests must include valid credentials to access the messaging services.

### Required Authentication Parameters:

- **username:** Your account identifier provided by the SMS platform
- **apikey:** Your unique API key for request authentication
- **signature:** Your registered Sender ID

**Note:** Your username and API key will be provided by the SMS platform administrator upon account setup. Keep your API key secure and do not share it publicly.

## 3. Base URL & Endpoints

---

The Ved Tech Labs API supports both HTTP and HTTPS protocols. For security purposes, HTTPS is recommended for all production implementations.

**Base URL:** <https://your-domain.com/pushapi/>

### Available Endpoints:

| Endpoint          | Method | Description                      |
|-------------------|--------|----------------------------------|
| /sendmsg          | GET    | Send single SMS message          |
| /sendbulkmsg      | GET    | Send bulk SMS messages           |
| /sendxmlmsg       | POST   | Send SMS via XML interface       |
| /json/sendbulkmsg | POST   | Send bulk SMS via JSON interface |

## 4. PUSH API

The PUSH API is the primary interface for sending SMS messages. It supports both GET and POST methods and provides comprehensive parameter options for message customization.

### Parameter List:

|   |           |        |          |     |                                                                                    |
|---|-----------|--------|----------|-----|------------------------------------------------------------------------------------|
| 1 | username  | String | Required | All | Account id; will be provided by SMS Platform                                       |
| 2 | dest      | String | Required | All | The target mobile number on which the SMS is being sent                            |
|   |           |        |          |     |                                                                                    |
| 3 | apikey    | String | Required | All | User specific key for every request                                                |
| 4 | signature | String | Required | All | Sender ID                                                                          |
| 5 | msgType   | String | Required | All | Type of message (PM for plain text or UC for Unicode message/multilingual message) |
| 6 | msgText   | String | Required | All | Text to be sent                                                                    |

| S.No | Parameter  | Type    | Required/Optional | Use       | Description                                                                                                                        |
|------|------------|---------|-------------------|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| 7    | custref    | String  | Optional          | All       | Customer reference key specific to campaign                                                                                        |
| 8    | entityid   | Numeric | Optional          | All       | DLT register Entity ID for the Header                                                                                              |
| 9    | templateid | Numeric | Optional          | All       | DLT register Template ID for the Message Template                                                                                  |
| 11   | domain     | String  | Optional          | Short URL | User domain to be used in short URL but that should be approved in platform                                                        |
| 12   | converturl | String  | Optional          | Short URL | This flag can be used. if user don't want to convert URL then use this with N. By default its value is Y.                          |
| 13   | campaign   | String  | Optional          | Short URL | Campaign name for the campaign, if not provided. Then it will be autogenerated by system for the day and can be used for tracking. |
| 14   | crmurl     | String  | Optional          | Short URL | callback url which can be used for short url tracking. Passing the clicking values                                                 |

## Sample URL Format:

Method Type - GET

Endpoint : [https://xyz.com/pushapi/sendmsg?](https://xyz.com/pushapi/sendmsg?username=xxxxxxx&dest=xxxxxxx&apikey=12345&signature=SENDERID&msgtype=PM&msgtxt=message&entityid=XXXXXXXXXX&templateid=XXXXXXXXXXXXXX)

[username=xxxxxxx&dest=xxxxxxx&apikey=12345&signature=SENDERID&msgtype=PM&msgtxt=message&entityid=XXXXXXXXXX&templateid=XXXXXXXXXXXXXX](https://xyz.com/pushapi/sendmsg?username=xxxxxxx&dest=xxxxxxx&apikey=12345&signature=SENDERID&msgtype=PM&msgtxt=message&entityid=XXXXXXXXXX&templateid=XXXXXXXXXXXXXX)

## Message Type Examples:

### Plain Text Message:

[http://domain/pushapi/sendmsg?](http://domain/pushapi/sendmsg?username=xxxxxxx&dest=xxxxxxxxx&apikey=12345&signature=SENDERID&msgtype=PM&msgtxt=message&custref=xxxxx)

[username=xxxxxxx&dest=xxxxxxxxx&apikey=12345&signature=SENDERID&msgtype=PM&msgtxt=message&custref=xxxxx](http://domain/pushapi/sendmsg?username=xxxxxxx&dest=xxxxxxxxx&apikey=12345&signature=SENDERID&msgtype=PM&msgtxt=message&custref=xxxxx)

# Unicode/Multi-Lingual Message:

```
http://domain/pushapi/sendmsg?  
username=xxxxxx&dest=xxxxxxxxxx&apikey=12345&signature=SENDERID&msgtype=UC&ms  
gtxt=message&custref=xxxxxx
```

## Bulk SMS:

Method Type : GET

Sample Request : [https://domain.com/pushapi/sendbulkmsg?](https://domain.com/pushapi/sendbulkmsg?username=xxxxxx&dest=xxxxxxxxxx,xxxxxxxxxx,xxxxxxxxxx,xxxxxxxxxx&apikey=12345&signature=SENDERID&msgtype=PM&msgtxt=message&entity_id=XXXXXXXXXX&templatei)  
[username=xxxxxx&dest=xxxxxxxxxx,xxxxxxxxxx,xxxxxxxxxx,xxxxxxxxxx&apikey=12345](https://domain.com/pushapi/sendbulkmsg?username=xxxxxx&dest=xxxxxxxxxx,xxxxxxxxxx,xxxxxxxxxx,xxxxxxxxxx&apikey=12345&signature=SENDERID&msgtype=PM&msgtxt=message&entity_id=XXXXXXXXXX&templatei)  
[&signature=SENDERID&msgtype=PM&msgtxt=message&entity\\_id=XXXXXXXXXX&templatei](https://domain.com/pushapi/sendbulkmsg?username=xxxxxx&dest=xxxxxxxxxx,xxxxxxxxxx,xxxxxxxxxx,xxxxxxxxxx&apikey=12345&signature=SENDERID&msgtype=PM&msgtxt=message&entity_id=XXXXXXXXXX&templatei)

**Note:** For bulk SMS, you can add multiple mobile numbers separated by commas in the dest parameter.

## 5. XML Interface

---

The XML Interface provides a structured way to send SMS messages using XML format. This interface supports POST method only and is ideal for complex messaging scenarios.

## Supported Method:

POST

## Endpoint:

Method : POST  
Endpoint : <https://yourdomain.com/pushapi/sendxmlmsg>  
Content-Type : application/xml

## XML Structure:

The XML interface supports three messaging patterns:

- **One to One:** Send a single message to a single recipient

```
<xmlPushRequest username="XXXX" pin="XXXX">
  <campaignName>XXXX</campaignName>
  <entityId>XXXXXXXXXXXX</entityId>
  <data>
    <from>XXXX</from>
    <recipientList>
      <recipient>
        <destAddress>XXXXXXXXXXXX</destAddress>
        <custref>XXXX</custref>
      </recipient>
    </recipientList>
    <message>
      <templateId>XXXXXXXXXXXX</templateId>
      <messageType>PM</messageType>
      <messageTxt>Your message text goes here.</messageTxt>
    </message>
  </data>
</xmlPushRequest>
```

- **One to Many:** Send the same message to multiple recipients

```
<xmlPushRequest username="XXXX" pin="XXXX">
  <campaignName>XXXX</campaignName>
  <entityId>XXXXXXXXXXXX</entityId>
  <data>
    <from>XXXX</from>
    <recipientList>
      <recipient>
        <destAddress>XXXXXXXXXX</destAddress>
        <custref>XXXX</custref>
      </recipient>
      <recipient>
        <destAddress>XXXXXXXXXX</destAddress>
        <custref>XXXX</custref>
      </recipient>
      <recipient>
        <destAddress>XXXXXXXXXX</destAddress>
        <custref>XXXX</custref>
      </recipient>
    </recipientList>
    <message>
      <templateId>XXXXXXXXXXXX</templateId>
      <messageType>PM</messageType>
      <messageTxt>Your message text goes here.</messageTxt>
    </message>
  </data>
</xmlPushRequest>
```

- **Many to Many:** Send different messages to different recipients

**Content-Type:** application/xml

**Method:** POST

**Encoding:** UTF-8

```
<xmlPushRequest username="XXXX" pin="XXXX">
  <campaignName>XXXX</campaignName>
  <entityId>XXXXXXXXXXXX</entityId>

  <data>
    <from>XXXX</from>
    <recipientList>
      <recipient>
        <destAddress>XXXXXXXXXX</destAddress>
        <custref>XXXX</custref>
      </recipient>
    </recipientList>
    <message>
      <templateId>XXXXXXXXXXXX</templateId>
      <messageType>PM</messageType>
      <messageTxt>Message text A</messageTxt>
    </message>
  </data>

  <data>
    <from>XXXX</from>
    <recipientList>
      <recipient>
        <destAddress>XXXXXXXXXX</destAddress>
        <custref>XXXX</custref>
      </recipient>
    </recipientList>
    <message>
      <templateId>XXXXXXXXXXXX</templateId>
      <messageType>PM</messageType>
      <messageTxt>Message text B</messageTxt>
    </message>
  </data>
```

## 6. JSON API

The JSON API provides a modern RESTful interface for sending bulk SMS messages. It uses JSON format for both request and response, making it easy to integrate with modern applications.

### ▪ One to One

Endpoint : <https://domainapi/pushapi/json/sendbulkmsg>  
Method Type : POST  
Content-Type : application/json

```
{
  "username": "XXXX",
  "password": "XXXX",
  "senderid": "XXXX",
  "entityid": "XXXXXXXXXXXX",
  "campaignname": "XXXX",
  "smslist": [
    {
      "text": "Your OTP is 123456. Do not share it.",
      "mobiles": "91XXXXXXXXXX"
      "messagetype": "PM",
      "custref": "XXXX1",
      "templateid": "XXXXXXXXXXXX"
    }
  ]
}
```

### ▪ One to Many

Endpoint : <https://domainapi/pushapi/json/sendbulkmsg>  
Method Type : POST  
Content-Type : application/json

```
{
  "username": "XXXX",
  "password": "XXXX",
  "senderid": "XXXX",
  "entityid": "XXXXXXXXXXXX",
  "campaignname": "XXXX",
  "smslist": [
    {
      "text": "Your OTP is 123456. Do not share it.",
      "mobiles": "91XXXXXXXXXX,91XXXXXXXXXX",
      "messagetype": "PM",
      "custref": "XXXX1",
      "templateid": "XXXXXXXXXXXX"
    }
  ]
}
```

- **Many to Many**

Endpoint : <https://domainapi/pushapi/json/sendbulkmsg>  
Method Type : POST  
Content-Type : application/json

```
{
  "username": "XXXX",
  "password": "XXXX",
  "senderid": "XXXX",
  "entityid": "XXXXXXXXXXXX",
  "campaignname": "XXXX",
  "smslist": [
    {
      "text": "Your Message Text 1 Here.",
      "mobiles": "91XXXXXXXXXX,91XXXXXXXXXX",
      "messagetype": "PM",
      "custref": "XXXX1",
      "templateid": "XXXXXXXXXXXX"
    },
    {
      "text": " Your Message Text 2 Here.",
      "mobiles": "91XXXXXXXXXX,91XXXXXXXXXX",
      "messagetype": "PM",
      "custref": "XXXX2",
      "templateid": "XXXXXXXXXXXX"
    }
  ]
}
```

## 7. Response Formats

---

The Ved Tech Labs API returns structured JSON responses for all requests. Response formats vary based on the type of message and API interface used.

# Success Response Structure:

## Sample Success Response:

```
{ "code": "6001", "desc": "Message received by platform.", "reqId":
"0332250011593103502744199", "time": "2023-02-25 22:15:02.744", "custRef":
"12345", "partMessageIds": ["0332250011593103502744199"],
"totalMessageParts": 1, "campaignName": "test" }
```

# Success Response with Short URL:

```
{ "code": "6001", "desc": "Message received by platform.", "reqId":
"0332250011593076672191330", "time": "2023-02-25 14:47:52.191", "custRef":
"12345", "longUrl": "http://www.google.co.in", "shortUrl": "gmly.in/cL",
"partMessageIds": ["0332250011593076672191330"], "totalMessageParts": 1,
"campaignName": "test" }
```

# Response Fields Explanation:

| Field             | Type   | Description                                      |
|-------------------|--------|--------------------------------------------------|
| code              | String | Response code indicating success or failure      |
| desc              | String | Human-readable description of the response       |
| reqId             | String | Unique request identifier for tracking           |
| time              | String | Timestamp of the request processing              |
| custRef           | String | Customer reference provided in the request       |
| partMessageIds    | Array  | Array of message part IDs for multipart messages |
| totalMessageParts | Number | Total number of message parts                    |
| campaignName      | String | Name of the campaign                             |
| longUrl           | String | Original long URL (if URL shortening is used)    |
| shortUrl          | String | Generated short URL                              |

# CRM URL Callback Format:

```
https://yourdomain.com/callback?reqid=##messageid##&mob=##mobile##&reqtime=##submittime##&deliverytime=##deliverytime##&deliverycode=##status##&status=##deliverycode##
```

## 8. Error Codes

The Ved Tech Labs API uses standardized error codes to indicate different types of failures. Understanding these codes helps in debugging and handling errors appropriately.

### Sample Error Response:

```
{ "code": "500", "desc": "Internal error occurred.", "reqId": null, "time": null, "custRef": null }
```

### Common Error Codes:

| Error Code | Description                            | Resolution                                         |
|------------|----------------------------------------|----------------------------------------------------|
| 500        | Internal error occurred                | Contact support team for assistance                |
| 114        | Invalid API Key                        | Invalid API key                                    |
| 110        | Invalid destination number             | Verify mobile number format (include country code) |
| 117        | Invalid message text                   | Provide valid message content                      |
| 105        | Invalid sender ID                      | Use approved sender ID from your account           |
| 6001       | Message received by platform (Success) | Message successfully queued for delivery           |

**Note:** Positive codes (like 6001) indicate success, while negative codes indicate various types of errors.

## 9. Contact Support

| Support Type | Contact Method | Response Time | Availability |
|--------------|----------------|---------------|--------------|
|--------------|----------------|---------------|--------------|

Our technical support team is available to assist you with integration, troubleshooting, and optimization of your SMS messaging implementation.

### Before Contacting Support:

- Check your API credentials and permissions
- Review error codes and messages
- Test with sample requests provided in this manual
- Gather relevant logs and error messages
- Prepare your account details and use case information

**Business Hours:** Monday to Friday, 9:00 AM to 6:00 PM (IST)

**Emergency Support:** Available 24/7 for critical production issues
